

The current climate emergency requires us to **speed up the energy transition** and achieve carbon neutrality in France and Europe by 2050. A quick and efficient change is necessary, it is now integrated into the Loi Energie-Climat (2019 French energy and climate law) and the amendments to the NLCS (National Low Carbon Strategy) and PPE (Multi-annual Energy Plan).

Far-reaching changes of the actual energy models rely on the global use of technologies with high decarbonisation potential (in industry, buildings, transport, etc.) such as **renewable and recovered energies**. Furthermore, such changes involve a higher control of consumption through means such as energy efficiency and **smart grid management**.

Key stakeholders in energy production and consumption are committed to invest in more **decentralised, digitalised and shared systems** to integrate them into urban and territorial economic development dynamics.

150

exhibitors from the Energy sector

10 000

visitors (manufacturers, public authorities, building industries...) interested in this sector

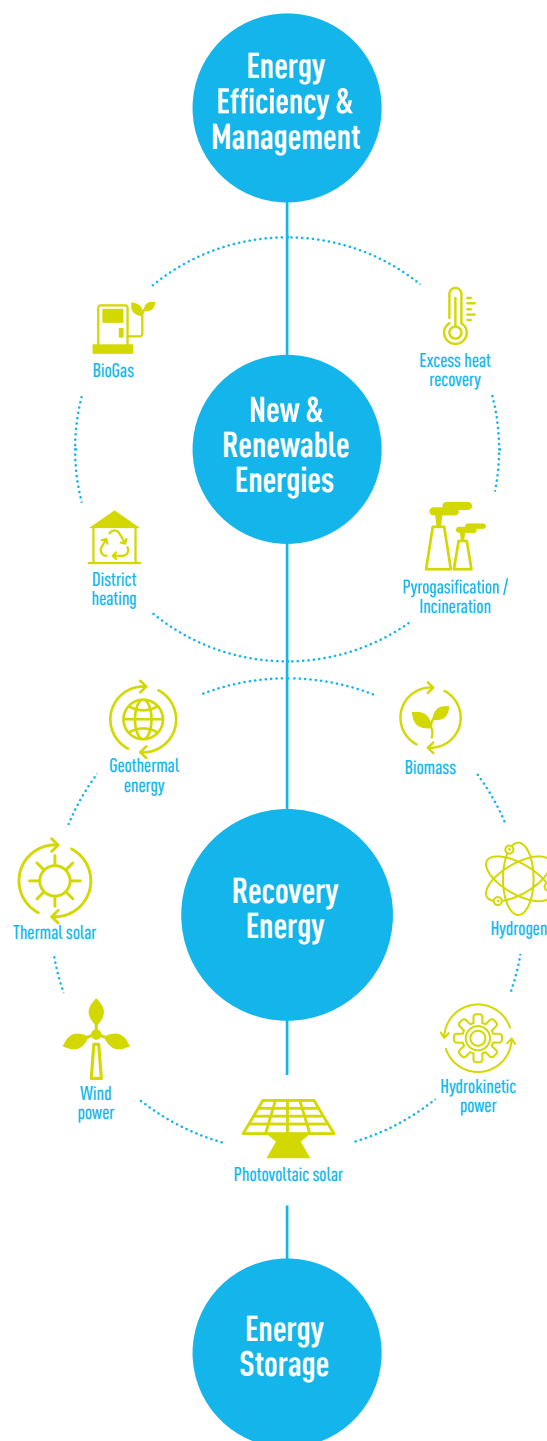

67

conferences bringing together more than 1500 participants

2

companies in this sector have won the Innovation Showcase: Starklab and STEPSol

Marc-Aurèle Maugat Sales Manager
